

RELIABILITY BEST PRACTICE GUIDANCE

Astrimar provides **corporate support** to operators and contractors to develop and implement **reliability engineering** and **management practices**.

Astrimar supports clients in the development and implementation of their own reliability and risk management processes using best practice and aligning with industry guidance such as in API RP 17N, the EI Integrity Management Guidelines and ISO 20815. We work towards consistency and coherency to help our clients deliver highly reliable systems and solutions, adding value to their business. System reliability, system design and operations are fully integrated.

We believe that reliability is an important input to both design and integrity management, to drive down the potential for failure throughout life. It is not just a measured output once design is complete.

Our support continues beyond the definition of company practice into training, roll-out and ongoing coaching to ensure value to the company is maximised at every stage in the lifecycle.
